1) Introduction:

In the 21st century, there are lots of inventions, but at the same time there are pollutions, global warming and so on are being formed, because of this there is no safe drinking water for the world's pollution. Nowadays, maintaining pure supply of water to the people is getting more challenging day by day. In India mainly in big cities the municipality corporation uses lots of chemicals to purify the river water then supply that to the people. And we reserved that water without any test. And we also don't know the water is either safe for drinking or not. And now a day's water quality monitoring in real time faces challenges because of global warming, limited water resources, growing population, etc. Hence there is a need of developing better methodologies to monitor the water quality parameters in real time. The water parameters pH measures the concentration of hydrogen ions. It shows the water is acidic or alkaline.

Pure water has 7 pH value, less than 7pH is acidic, more than 7pH is alkaline. The range of pH is 0-14pH. For drinking purpose it should be 6.5-8.5pH. Turbidity measures the large number of suspended particles in water that is invisible. Higher the turbidity, higher the risk of diarrhea, cholera. Lower the turbidity, then the water is clean. Temperature sensor measures how the water is, hot or cold. Here in this paper we tried to find the problem and then make a solution for it.

The experimental results show that the system has great prospect and can be used to operate in real world environment for optimum control and protection of water resources by providing key actors with relevant and timely information to facilitate quick action taking.

The real time monitoring of water quality in IoT environment	N. Vijayakumar and R.Ramya	5 International Conference on Innovations in Information, Embedded and Communication Systems (ICIIECS), 2015, pp. 1-5	5 International Conference on Innovations in Information, Embedded and Communication Systems (ICIIECS), 2015, pp. 1-5

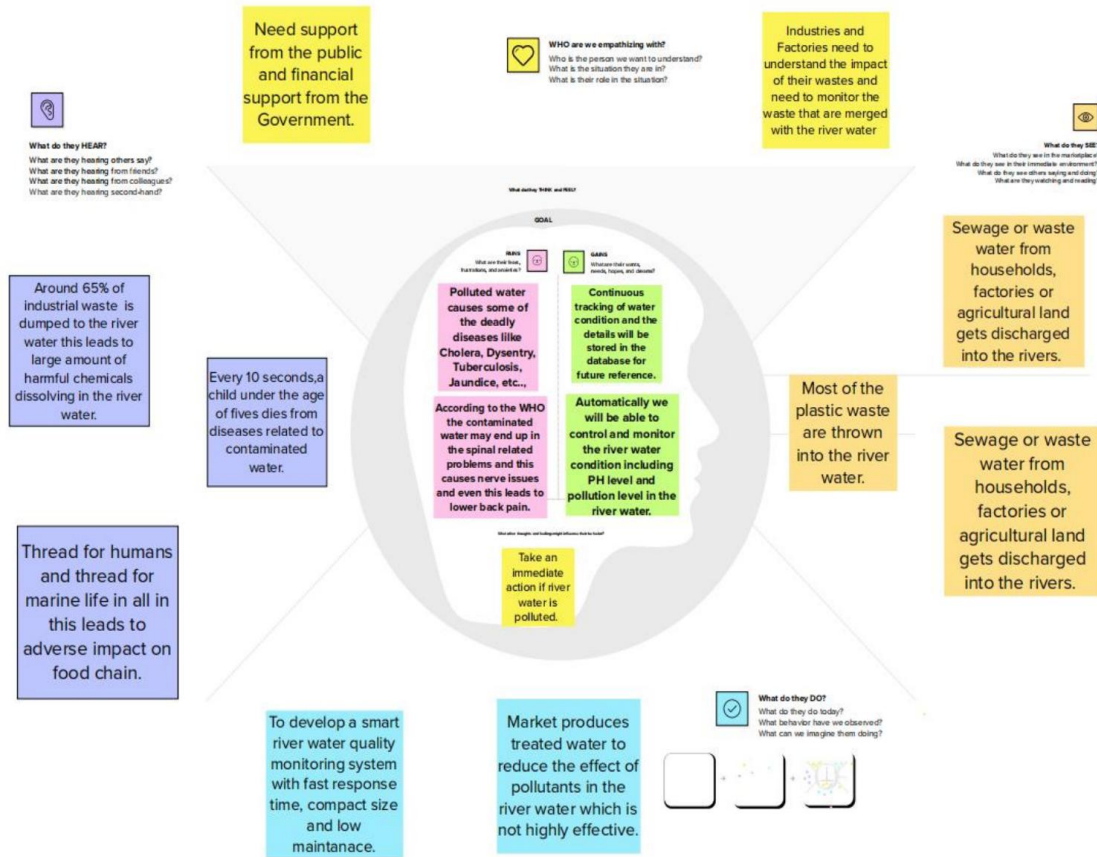

Problem Statement Definition:

Now a days water pollution is one of the biggest fears for the green globalization. In order to ensure the safe of water quality is needs to be monitor in real time. water quality is affected by both point and non-point sources of pollution, which include sewage discharge, discharge from industries, run-off from agricultural fields and urban run-off. It is difficult to maintain river water quality monitoring. By focusing on the above issues, low cost monitoring system to monitor water in real time using IoT is proposed. In this system quality parameters are measured using different sensors such as pH, turbidity, temperature and communicating data onto a platform microcontroller system and GPRS are used.

2) IDEATION & PROPOSED SOLUTION

Empathy Map Canvas:

Ideation & Brainstorming

Final Report

Proposed Solution

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Real Time River water quality monitoring and controlling using IOT.
2.	Idea / Solution description	Monitoring water parameters such as pH, TDS, Salinity and hardness using Arduino and sensors.
3.	Novelty / Uniqueness	<ul style="list-style-type: none"> Data samples are collected and accurate parameter values are obtained. Individual notification will be sent to people and to the authorities.
4.	Social Impact / Customer Satisfaction	<ul style="list-style-type: none"> Pollution in water can be identified. Eutrophication can be controlled. Parameters such as chemical, radiological and biological can be checked to increase the impact on health and vegetation.
5.	Business Model (Revenue Model)	<ul style="list-style-type: none"> Cost effective model which people can afford. Application is flexible to users.
6.	Scalability of the Solution	In this model, data can be collected and sampled using IOT and cloud services, can be viewed from any location at any time. Water quality can be measured even in remote areas without laboratory equipments.

Problem Solution fit

Define CS, fit into CC	1. CUSTOMER SEGMENT(S) Who is your customer? CS Our customers are ordinary people those who depend on river water for their day to day activities.	6. CUSTOMER CONSTRAINTS What constraints prevent your customers from taking action or limit their choices of solutions? CC <ul style="list-style-type: none">Cannot find river water quality parameters like chemical, biological, and radiological parameters.Cannot easily avail network resources, appropriate devices.Budget and time management.	5. AVAILABLE SOLUTIONS Which solutions are available to the customers when they face the problem? AS <ul style="list-style-type: none">CWC (Central Water Commission) monitors water quality, by collecting samples from representative locations within the processing and distribution systems.TWAD – The local authorities must ensure the quality of the supplying river water.	Explore AS, differentiate
Focus on J&P, tap into BE	2. JOBS-TO-BE-DONE / PROBLEMS Which jobs-to-be-done (or problems) do you address for your customers? <ul style="list-style-type: none">Consumer should know the quality of water before consuming in order to avoid diseases and from harmful contaminations.	9. PROBLEM ROOT CAUSE What is the real reason that this problem exists? What is the back story behind the need to do this job? <ul style="list-style-type: none">Industrial wastesEutrophicationLack of public awareness	7. BEHAVIOUR What does your customer do to address the problem and get the job done? <ul style="list-style-type: none">After finding impurities in river water, the consumer complains it directly to the respective government authorities.Consumer tries to filter visible waste and boils water before consuming.	Focus on J&P, tap into BE

Final Report

3. TRIGGERS What triggers customers to act? <ul style="list-style-type: none"> Public awareness To prevent from water borne diseases such as cholera, diarrhea, typhoid and so on. To check the pH, TDS, Salinity and hardness in the river water. 	10. YOUR SOLUTION <ul style="list-style-type: none"> pH level and salinity should be monitored. Turbidity and TDS should be determined. Temperature must be constantly monitored. Whenever there is a change, instant message should be sent to authorities. Monthly report on water maintenance should be displayed to the public. 	8. CHANNELS of BEHAVIOUR ONLINE What kind of actions do customers take online? <ul style="list-style-type: none"> Video tutorial made to bring awareness among public. Social media campaigns on polluted water. OFFLINE What kind of actions do customers take offline? <ul style="list-style-type: none"> Creating awareness using Sign Boards, rallies. Publish Advertisement on Newspapers regarding polluted water.
4. EMOTIONS: BEFORE / AFTER How do customers feel when they face a problem or a job and afterwards? <ul style="list-style-type: none"> Before implementing – people find hard to enjoy boating, fishing and provision of safe drinking water. After implementing – People can monitor and regulate the water pollution, it leads way to healthy life. 		

3) REQUIREMENT ANALYSIS

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Login	Confirmation through verified password.
FR-2	View Water Details	View current water details in website View traditional water eligibility in website.
FR-3	Historical Data	The Data are stored in the cloud from the beginning stage till the Updation.
FR-4	User Authentication	The credentials is accessible only to the authorized users to access the model.
FR-5	Users Guidelines	There are some specific guidelines which has to be followed by the users.
FR-6	Logout	Logs out the user successfully.

Non-functional Requirements:

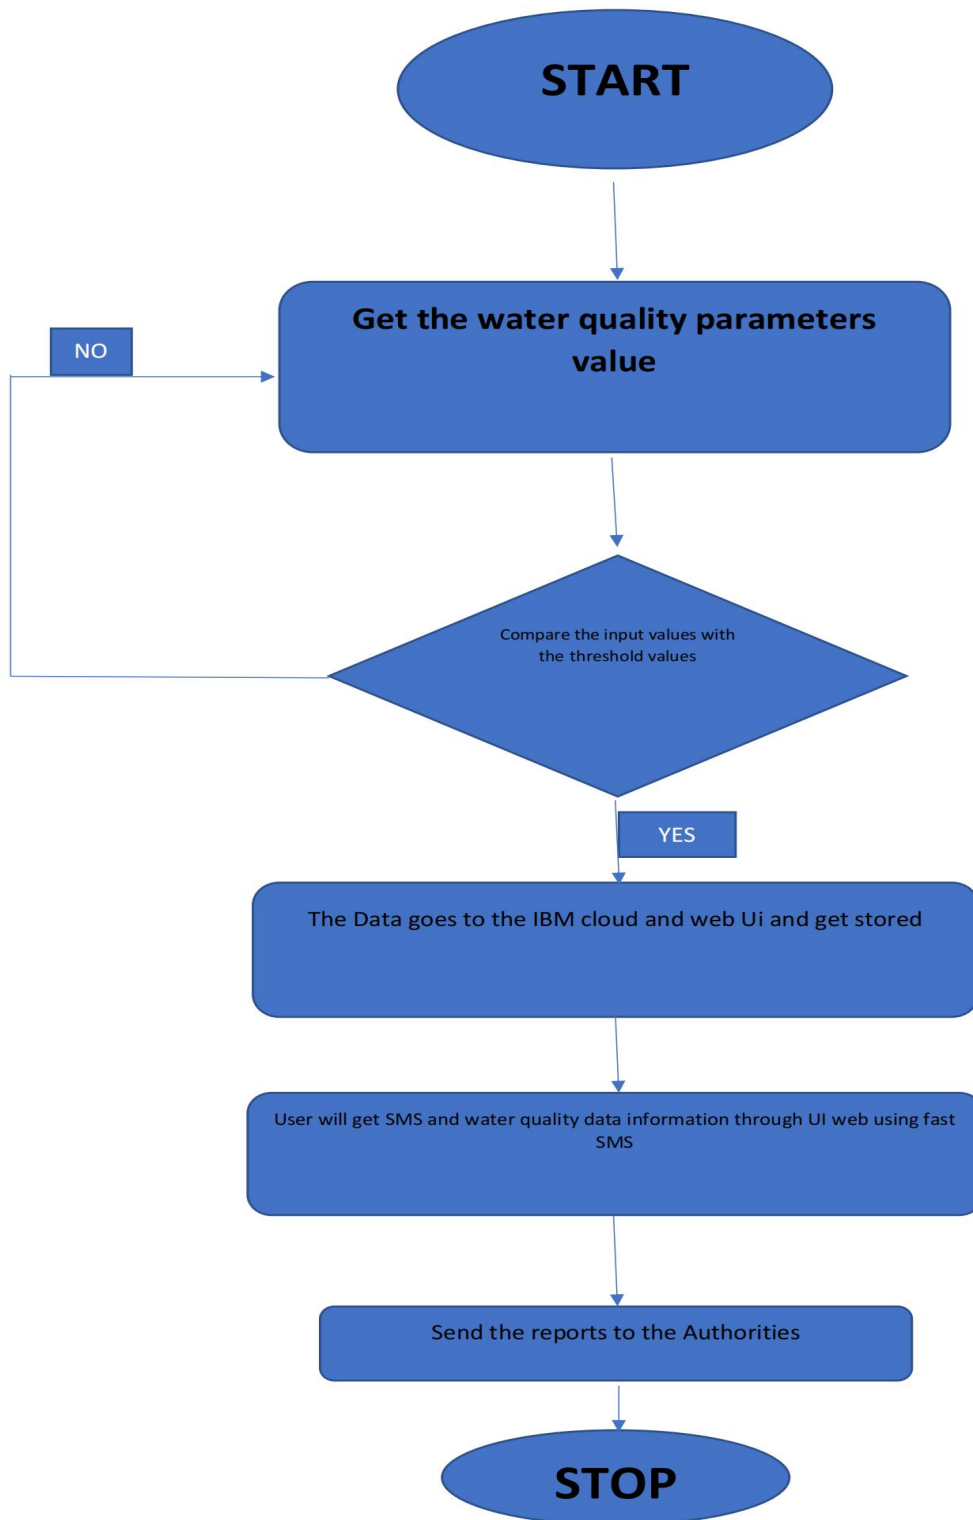

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	Load time for user interface screens shall not be more than 2 seconds.
NFR-2	Security	User account is password protected and Account creation done only after email verification.
NFR-3	Reliability	Users can access their account 98% of the time without failure.
NFR-4	Performance	Load time for user interface screens shall not be more than 2 seconds. For that High quality sensors are used to ease the customer's work.
NFR-5	Availability	The model is designed in such a way that are available, usable and can be modified anytime. Maximum down time will be about 4 hours.
NFR-6	Scalability	System can handle about 1000 users at any given time. The final data should be easily understandable.

Final Report

7) CONCLUSION

An IoT system was developed to monitor river water in real time. The IoT system was used to collect the data from identified stations for different water quality parameters such as pH, turbidity, temperature and conductivity to generate a data set that was used to monitor the quality of water. The collected data set can also be used in future to make the system intelligent by applying machine learning techniques.
